# security quotient®

How to prevent web scraping on websites?

Introduce captchas

1

Use captchas to ensure the user is human. Captchas can eliminate many automated visitors.

2

Use JavaScript verification

Insert complex JavaScript calculations into your page to verify that users are real web browsers, as most scrapers can't process complex JavaScript.

3

Set limits on requests

Limit the number of requests and connections to your page to reduce scraper visits, as human users access pages more slowly than automated scrapers.

Obfuscate or hide data

4

Publish your data as images or flash to prevent extraction, as web scrapers mainly target text data.

5

Regularly update HTML tags

Frequently change HTML tags, add spaces, comments, or new tags to disrupt scrapers programmed to search for specific content.
