WHAT ARE THE INDICATORS OF AN APT ATTACK?

1

Unexpected logins

Frequent logins to servers at odd hours may indicate an APT attack, as attackers often work in different time zones or at night to avoid detection.

2
Increase in backdoor trojans

A rise in detected backdoor trojans could signal an APT attack. Attackers use these trojans to maintain persistent access even if login credentials change.

3

Spear-phishing emails

Spear-phishing emails targeting senior leadership team are a clear sign of an APT attack aiming to gain access to restricted data.
